

# NVDIMM DSM Interface Example

---

## ***Revision 1.3***

***December 2016***

***See the change bars associated with the following changes to this document:***

- 1) Common \_DSMs supported by all NVDIMMs have been removed from this document.**
- 2) Changes to SMART Health Info output payload as follows:**
  - a. Added NVDIMM Controller temperature to the generic SMART payload to match the Alarm Trip bits already defined in the existing generic SMART payload and Get SMART Threshold alarms. Without this change there is no way to determine what the Controller temperature is.**
  - b. Added 10 reserved bytes to support future additional SMART information to match the 5 reserved bits in the Validation Flags and the 5 extra bits in the Threshold Alarm Control reserved bits (in the Get SMART Threshold DSM output payload). This will allow future additions without making a mess of the existing payload data.**
- 3) Get SMART Threshold DSM – Changed the size of the Threshold Alarm Control to 1 byte to match the amount of space available in the SMART Health Info DSM output payload and added 1 byte of reserved to follow.**
- 4) Added Extended Status returned for Get Namespace Label Size if a locked NVDIMM is encountered.**

# 1 Introduction

---

## 1.1 Document Scope

This document is targeted to writers of BIOS and OS drivers for NVDIMMs whose design adheres to the NFIT Tables in the ACPI V6.0 specification. This document specifically discusses the NVDIMM Device Specific Method (\_DSM) example.

## 1.2 Related Documents

The related documents are ACPI Specification Version 6.0 (<http://www.uefi.org/specifications>) and NVDIMM Namespace Specification (<http://pmem.io/documents>).

## 1.3 Terminology

Refer to Table 1-1 for definitions of terms used in this document.

**Table 1-1 – Terminology**

Term	Description
NFIT	The NVDIMM Firmware Interface Table defines the ACPI 6.1 specified information created by the BIOS to inform the OS about NVDIMMs in the system.
NVDIMM	Non-volatile memory in a DIMM form factor.
NVDIMM Namespace Label	Labels, stored at a known location on NVDIMMs, which define the DIMM's contribution to NVDIMM Namespaces. This is a software mechanism; the DIMM itself just sees the labels as part of the overall data stored on the DIMM.
NVDIMM Namespace	Similar to an NVMe Namespace or a Logical Unit (LUN) on a SCSI disk, this is a software mechanism for managing ranges of persistence on NVDIMMs.
Persistent Memory	Byte-addressable memory that retains its contents after power loss.
SPA	System Physical Address. A physical address on the host operating system.

## **2 *\_DSM Interface for NVDIMM ACPI0012 Root Device - Example***

---

**All Root ACPI0012 scoped \_DSMs are now found in the following specifications and have been removed from this document, which will now only document the NVDIMM example \_DSMs.**

Please see:

ACPI Specification V6.0 – Initial NVDIMM & NFIT additions, Query ARS Capabilities, Start ARS, Query ARS Status \_DSMs

ACPI Specification V6.1 – Clear Uncorrectable Error \_DSM

## 3 ***\_DSM Interface for NVDIMM Device (non-root) - Example***

---

Platforms that have the `_DSM` interface implemented, as outlined in this section, can support a NVDIMM region with Region Format Interface Code (RFIC) of 0x0201.

Note that the `_DSM` methods defined in this section are required to be implemented under NVDIMM devices that are child devices of NVDIMM objects associated with `_HID` of ACPI0012 in ACPI name space hierarchy.

*Arg0 – UUID (set to 4309AC30-0D11-11E4-9191-0800200C9A66)*

*Arg1 – Revision ID (set to 1)*

*Arg2 – Function Index*

*0 – Query command implemented per ACPI Specification*

*1 – SMART and Health Info*

*2 – Get SMART Threshold*

*3 – Get Block NVDIMM Flags*

*4 – Get Namespace Label Size*

*5 – Get Namespace Label Data*

*6 - Set Namespace Label Data*

*7 - Get Vendor-Specific Command Effect Log Size*

*8 - Get Vendor-Specific Command Effect Log*

*9 – Vendor-Specific Command*

*Arg3 – A package containing parameters for the function specified by the `UUID`, `Revision ID`, and `Function Index`. The layout of the package for each command along with the corresponding output are illustrated in the respective *Function Index* description sections. For DSM functions that take an input argument, `Arg3` is a package containing a Buffer, list of bytes, value. The output of all functions in the DSM is a Buffer, list of bytes, value.*

*Implementation Note: This section adopts the following conventions for the \_DSM function return status codes. This status can always be utilized for the status of each \_DSM function, whether the specific status value is defined in the output buffer or not:*

*Bytes[1-0]*

- 0 – Success*
- 1 – Failure - Function Not Supported*
- 2 – Failure - Non-Existing Memory Device*
- 3 – Failure - Invalid Input Parameters*
- 4 – Failure – HW Error*
- 5 – Failure – Retry Suggested*
- 6 – Failure – Unknown Reason*
- 7 – Vendor Specific Error (details in Extended Status Field)*
- 8-FFFFh Reserved*

*Bytes[3-2] Extended Status Field (Vendor defined)*

### 3.1 SMART and Health Info (Function Index 1)

This command requests the leaf node device to return Smart and Health information for the requested device. Note that the Smart data defined here does not follow standardized T10/T13 SCSI and SATA SMART payload definitions. The payload returned here is specific to the FIC 0x0301 and 0x0201 NVDIMM devices and may require translation to utilize with existing standardized SMART applications.

#### Function Input

None

#### Function Output

The following tables outline the expected output payload for this command.

Field	Byte Length	Byte Offset	Description
Status	2	0	Defined above
Extended Status	2	2	Extended Status Field (Vendor Defined)
Smart and Health Data	128	4	Output formatted as shown in Table 3-1.

**Table 3-1 SMART and Health Data Format**

Bytes	Description
03-00	<p>Validation Flags – if the corresponding validation flag is not set in this field, it is indication to software that the corresponding field is not valid and must not be interpreted.</p> <p>Bit[0] – if set to 1, indicates that Health Status field is valid</p> <p><u>Bit[1] – if set to 1, indicates that Spare Blocks field is valid</u></p> <p><u>Bit[2] – if set to 1, indicates that Percentage Used field is valid</u></p> <p>Bit[3] – if set to 1, indicates that Current <u>NVDIMM Media</u> Temperature field is valid</p> <p><u>Bit[4] – if set to 1, indicates that Current NVDIMM Controller Temperature field is valid</u></p> <p><u>Bits[8:5] – Reserved</u></p> <p>Bit[9] – if set to 1, indicates that Alarm Trips field is valid</p> <p>Bit[10] – if set to 1, indicates that Last Shutdown Status field is valid</p> <p>Bit[11] – if set to 1, indicates that Size of Vendor-specific Data field is valid. If this field is not valid, the software will ignore the vendor-specific data fields.</p> <p>Bits[31:12] – Reserved</p>
07-04	Reserved
08	<p>Health Status (HS): Overall health summary</p> <p>Bit[0] – if set to 1, indicates Non-Critical condition, maintenance required but no data loss detected</p> <p>Bit[1] – if set to 1, indicates Critical condition, features or performance degraded due to failures but no data loss detected</p> <p>Bit[2] – if set to 1, indicates fatal condition, data loss is detected or is imminent</p> <p>Bits[7:3] - Reserved</p>
<u>09</u>	<p><u>Spare Blocks: Remaining Spare Capacity as % of factory configured space</u></p> <p><u>Valid range 0 to 100.</u></p>
<u>10</u>	<p><u>Percentage Used: Device life span as percentage, 100 = the warranted life span of the device has been reached</u></p>

NVDIMM DSM Interface Example

<u>11</u>	<p><u>Alarm Trips: Bits to signify if values have tripped their respective alarm thresholds</u></p> <p><u>Bit[0] - Spare Blocks Trip - If set then the spare block value has reached the pre-programmed threshold limit</u></p> <p><u>Bit[1] – NVDIMM Media Temperature Trip - If set then the NVDIMM Media temperature value has reached the pre-programmed threshold limit</u></p> <p><u>Bit[2] – NVDIMM Controller Temperature Trip - If set then the NVDIMM Controller temperature value has reached the pre-programmed threshold limit</u></p> <p><u>Bits[7:3] - Reserved</u></p>
<u>13-12</u>	<p>Current NVDIMM Media Temperature: Current temperature of the NVDIMM Media</p> <p>Bits[14:0] - Temperature in 1/16<sup>th</sup> Celsius resolution.</p> <p>Bit[15] – Sign bit for temperature (1 = negative, 0 = positive)</p>
<u>15-14</u>	<p><u>Current NVDIMM Controller Temperature: Current temperature of the NVDIMM Controller</u></p> <p><u>Bits[14:0] - Temperature in 1/16<sup>th</sup> Celsius resolution.</u></p> <p><u>Bit[15] – Sign bit for temperature (1 = negative, 0 = positive)</u></p>
<u>30-16</u>	<u>Reserved</u>
<u>31</u>	<p>Last Shutdown Status: status of last shutdown</p> <p>0 – Clean shutdown</p> <p>1 - 0FFh – Not Clean Shutdown, indicates that there was either a platform or memory device-related failure occurred when saving data targeted for this memory device.</p>
<u>35-32</u>	Size of Vendor-specific Data. If set to 0, indicates that there is no vendor specific data that follows. Otherwise, indicates size of the Vendor-specific data that follows.
<u>127-36</u>	Vendor-specific Data

### 3.2 Get SMART Threshold (Function Index 2)

This command requests the leaf node device to return Smart Threshold values that have been programmed by the platform for the requested device.

**Function Input**

None

**Function Output**

The following tables outline the expected output payload for this command.

Field	Byte Length	Byte Offset	Description
Status	2	0	Defined above
Extended Status	2	2	Extended Status Field (Vendor Defined)
Smart Threshold Data	8	4	Output formatted as shown in Table 3-2.

**Table 3-2 SMART Threshold Data Format**

Bytes	Description
<u>0</u>	<p>Threshold Alarm Control – If a bit is set to 1, the specific alarm is enabled and the corresponding Alarm Trip bit in the SMART Health Status output payload will be set when a specific threshold outlined below has been reached.</p> <p>Bit[0] - Spare Block Threshold Alarm Valid</p> <p>Bit[1] – NVDIMM Media Temperature Threshold Alarm Valid</p> <p>Bit[2] – NVDIMM Controller Temperature Threshold Alarm Valid</p> <p>Bits[7:3] - Reserved</p>
<u>1</u>	<u>Reserved</u>
2	Spare Block Threshold: Remaining Spare Capacity as % of factory configured space. Valid range 0 to 100.

NVDIMM DSM Interface Example

	<p>If the <i>Spare Block Threshold Alarm Valid</i> bit is enabled and when the space block capacity goes below this threshold, the <i>Spare Blocks Trip</i> bit will be set in the SMART and Health Data structure defined in Table 3-1.</p>
4-3	<p>NVDIMM Media Temperature Threshold</p> <p>Bits[14:0] – Temperature in 1/16<sup>th</sup> Celsius resolution.</p> <p>Bit[15] – Sign bit for temperature (1 = negative, 0 = positive)</p> <p>If the <i>NVDIMM Media Temperature Threshold Alarm Valid</i> bit is enabled and when the <i>NVDIMM Media</i> temperature goes above this value, the <i>NVDIMM Media Temperature Trip</i> bit will be set in the SMART and Health Data structure defined in Table 3-1.</p>
6-5	<p>NVDIMM Controller Temperature Threshold</p> <p>Bits[14:0] - Temperature in 1/16<sup>th</sup> Celsius resolution.</p> <p>Bit[15] - Sign bit for temperature (1 = negative, 0 = positive)</p> <p>If the <i>NVDIMM Controller Temperature Threshold Alarm Valid</i> bit is enabled and when the <i>NVDIMM Controller</i> temperature goes above this value, the <i>NVDIMM Controller Temperature Trip</i> bit will be set in the SMART and Health Data structure defined in Table 3-1.</p>
7	Reserved

### 3.3 Get Block NVDIMM Flags (Function Index 3)

This function that is only applicable if block mode is enabled in the NVDIMM (i.e., the Number of Block Control Windows field set is set to a non-zero value in the NVDIMM Control Region Structure). Used by the NVDIMM to report specific features or alternative sequences that need to be implemented by SW drivers.

#### Function Input

None

#### Function Output

The following tables outline the expected output payload for this command.

**Table 3-3 Get Block NVDIMM Flags - Output Format**

Field	Byte Length	Byte Offset	Description
Status	2	0	Defined above
Extended Status	2	2	Extended Status Field (Vendor Defined)
NVDIMM Flags	4	4	<p>Byte[0]</p> <p>Bit[0] – Block Data Window Invalidation Required – If this bit is set to 1, indicates that the NVDIMM requires the driver to flush previous data from cache lines that will be moved through the Block Data Window, before re-using the Block Data Window for read. If set to '0', flushing of previous data from cachelines that will be moved through the Block Data Window are handled by the platform or VMM. Typical usage of this flag is in a virtualized environment.</p> <p>Bit[1] – Command Register in Block Control Window Latch – If this bit is set to 1, indicates that after a write to the Command Register in Block Control Windows, the NVDIMM requires the software to read the same Command Register to ensure that the command is latched before reading contents from Block Data Window.</p> <p>If this bit is set to 0, software is allowed to read the contents of the Block Data Window immediately after writing to the Command Register of Block Control Window.</p> <p>Bits[7:2] – Reserved</p> <p>Note: If this command is not implemented, then the software should assume bit[0] and bit[1] are clear.</p> <p>Bytes[3-1] – Reserved</p>

### 3.4 Get Namespace Label Size (Function Index 4)

This command requests the leaf node device to return the size of the Namespace Label storage area for the requested device.

#### Function Input

None

#### Function Output

The following tables outline the expected output payload for this command. See **updated/new additions & clarifications** below for this existing LSM.

**Table 3-4 Get Namespace Label Size – Output Format**

Field	Byte Length	Byte Offset	Description
Status	2	0	Defined in <a href="#">Table 9-270</a> .
Extended Status	2	2	<u>Bit[0] – Extended Success Status - Locked Persistent Memory Region – The PMEM Region is currently in a locked state. This DSM is expected to continue to report a valid namespace label size, returns status success (0) and reports this extended status if the persistent memory region of the NVDIMMs are in a state that requires one or more security keys to be applied before the region is accessible.</u>
Size of Namespace Label Area	4	4	Size returned in bytes
Max Namespace Label Data Length	4	8	In bytes, Maximum size of the namespace label data length supported by the platform in <i>Get/Set Namespace Label Data</i> functions

### 3.5 Get Namespace Label Data (Function Index 5)

This command requests the leaf node device to return Namespace Label storage area data based on the requested buffer offset and length for the requested device.

#### Function Input

The following tables outline the expected input payload for this command.

**Table 3-5 Get Namespace Label Data – Input Format**

Field	Byte Length	Byte Offset	Description
Offset	4	0	In bytes  Indicates the offset in the namespace label data area, to which the namespace label data is to be read from the target NVDIMM
Length	4	4	In bytes

#### Function Output

The following tables outline the expected output payload for this command.

**Table 3-6 Get Namespace Label Data – Output Format**

Field	Byte Length	Byte Offset	Description
Status	2	0	Defined above  3 – Invalid Input Parameters - Offset + Length is > size of Namespace Label Data Area (Max Namespace Label Data Length from GetNamespaceLabelDataSize LSM) - Length is > maximum amount of data the OSPM can transfer in a single request
Extended Status	2	2	Extended Status Field (Vendor Defined)
Namespace Label Data	Varies	4	The size of the output is equal to input's <i>Length</i> if <i>Status</i> is Success; otherwise, the contents of rest of the output buffer are not valid.

### 3.6 Set Namespace Label Data (Function Index 6)

This command requests the leaf node device to update Namespace Label Data area data based on the requested buffer offset and length for the requested device.

#### Function Input

The following tables outline the expected input payload for this command.

**Table 3-7 Set Namespace Label Data – Input Format**

Field	Byte Length	Byte Offset	Description
Offset	4	0	In bytes  Indicates the offset in the namespace label data area, to which the <i>Namespace Label Data</i> is to be written to the target NVDIMM
Length	4	4	In bytes
Namespace Label Data	Varies	8	Namespace label data.  Size of the namespace label data is as indicated by <i>Length</i> field above.

#### Function Output

The following tables outline the expected output payload for this command.

**Table 3-8 Set Namespace Label Data – Output Format**

Field	Byte Length	Byte Offset	Description
Status	2	0	Defined above  3 – Invalid Input Parameters - Offset + Length is > size of Namespace Label Data Area (Max Namespace Label Data Length from GetNamespaceLabelDataSize LSM) - Length is > maximum amount of data the OSPM can transfer in a single request
Extended Status	2	2	Extended Status Field (Vendor Defined)

### 3.7 Get Vendor-Specific Command Effect Log Size (Function Index 7)

This command requests the leaf node device to return the Command Effect Log size for the requested device.

**Function Input**

None

**Function Output**

The following tables outline the expected output payload for this command.

**Table 3-9 Get Vendor Specific Command Effect Log Size – Output Format**

Field	Byte Length	Byte Offset	Description
Status	2	0	Defined above
Extended Status	2	2	Extended Status Field (Vendor Defined)
Max Command Effect Log Data Length	4	8	In bytes, Maximum size of the Vendor-specific command effect log data buffer supported by the platform

## 3.8 Get Vendor-Specific Command Effect Log (Function Index 8)

This command requests the leaf node device to return the Command Effect Log associated with the requested device. If the OpCode is not in the Command Effect log, OSPM may block the Vendor-Specific calls for that OpCode.

### Function Input

None

### Function Output

The following tables outline the expected output payload for this command.

**Table 3-10 Get Vendor Specific Command Effect Log Size – Output Format**

Field	Byte Length	Byte Offset	Description
Status	2	0	Defined above
Extended Status	2	2	Extended Status Field (Vendor Defined)
OpCode Count	2	4	Number of OpCode command effect logs returned
Reserved	2	6	
Command Effect Data	Varies	8	The command effect data for each OpCode. The Fields in Table 3-11 are repeated <i>OpCode Count</i> times.

**Table 3-11 Command Effect Data - Format**

Field	Byte Length	Byte Offset	Description
OpCode	4	0	OpCode representing a Vendor-specific command
OpCode Command Effect	4	4	Bit[0] – No Effects (NE) If set to 1, execution of this OpCode does not change DIMM state. If this bit is set, all the following bits should be clear. Bit[1] – Security State Change (SSC) If set to 1, execution of this Opcode results in immediate security state change of the NVDIMM. Bit[2] – DIMM Configuration Change after Reboot (DCC)

			<p>If set to 1, execution of this Opcode results in change to the configuration of the NVDIMM or data contained within persistent memory regions of the NVDIMM. The change does not take effect until the system reboots.</p> <p>Bit[3] – Immediate DIMM Configuration Change (IDCC)</p> <p>If set to 1, execution of this Opcode results in immediate change to the configuration of the NVDIMM or data contained within persistent memory regions of the NVDIMM.</p> <p>Bit[4] – Quiesce All IO (QIO)</p> <p>If set to 1, execution of this Opcode may disrupt on-going operations of the memory region covered by this NVDIMM. The outstanding IO operations corresponding to this NVDIMM must be quiesced before executing this command; otherwise, undefined system behavior will result.</p> <p>Bit[5] - Immediate DIMM Data Change (IDDC)</p> <p>If set to 1, execution of this Opcode results in immediate change to the data written to the NVDIMM.</p> <p>Bit[6] – Test Mode (TM)</p> <p>If set to 1, execution of this Opcode activates a test feature that may disrupt on-going operations. This may result in errors or error recovery operations.</p> <p>Bit[7] – Debug Mode (DM)</p> <p>If set to 1, execution of this Opcode activates a debug feature that is non-disruptive, but may alter performance characteristics of the NVDIMM.</p> <p>Bits[31:8] – Reserved</p>
--	--	--	--

### 3.9 Vendor-Specific Command (Function Index 9)

This command requests the leaf node device to execute the vendor specific command contained in the input payload for the requested device.

#### Function Input

The following tables outline the expected input payload for this command.

**Table 3-12 Vendor Specific Command – Input Format**

Field	Byte Length	Byte Offset	Description
OpCode	4	0	Vendor-specific command OpCode
OpCode Parameters Data Length	4	4	In bytes Length of OpCode parameters data
OpCode Parameters Data	Varies	8	Vendor-specific command input data

#### Function Output

The following tables outline the expected output payload for this command.

**Table 3-13 Vendor Specific Command – Output Format**

Field	Byte Length	Byte Offset	Description
Status	2	0	Defined above
Extended Status	2	2	Extended Status Field (Vendor Defined)
Output Data Length	4	4	In bytes. If <i>Status</i> is not <i>Success</i> , output data length returned is 0.
Output Data	Varies	8	The <i>Output Data</i> is valid only when the <i>Output Data Length</i> is non-zero.
